Code in Place 2024

Stanford CS106A

Section - Week 6

Today's Agenda

1. Check-In
How are we all doing?

2. Course Announcements
Diagnostic, Final Project

3. Concepts Review Lists, Dictionaries, Mutability

"Index Game", "List Practice", "Heads Up"

4. Practice Problems

Welcome to our final live Section!

What was your favorite problem, section, topic, or memory from your time in the course?

Course Announcements

Code in Place Diagnostic

- 50-minute <u>self-assessment</u> exam covering topics up through Week 5.
- Open-book.
- Not graded. You will not be judged for pass/fail.
- You'll get Al feedback. Course staff will also try to give human feedback if you submit on time.
- Check the diagnostic instructions page for deadline.
- Clicking the "Start Diagnostic" blue button will start the timer!

Course Announcements

Final Project

- Start thinking about ideas for a program you might want to build.
 - o Open ended, anything you can imagine.
 - o Can be something utilitarian, or something creative and fun.
 - An animation or game on the console or canvas.
 - o An app you can use in your personal life for family/work/study/etc.
- CIP 2020 Showcase:
 - https://compedu.stanford.edu/codeinplace/public/
- CIP 2021 Showcase:
 - https://codeinplace.stanford.edu/2021/showcase/

Please share your submitted project in our Section Forum, so we can all admire your wonderful creation!

Concepts Review

Intro to Data Structures: Lists & Dictionaries

Data Structure

- Special container for organizing, processing, retrieving, and storing data.
- Examples: list, tuple, dictionary, set, tree, stack, queue, graph

List

- An ordered collection of values.
- games = ["Elden Ring", "Zelda", "Diablo 4", "Genshin Impact"]

Dictionary

- An unordered collection of key/value pairs.
- movie scores = {"Godfather": 97, "Avatar": 81, "Morbius": 15}

Lists

The elements of a list are indexed, starting from 0.

superheroes = ["Batman", "Superman", "Spider-Man", "Iron Man"]

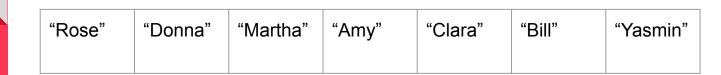

Index	0	1	2	3
Element	"Batman"	"Superman"	"Spider-Man"	"Iron Man"

Accessing individual elements:

```
>>> superheroes[0]
"Batman"

>>> superheroes[2]
"Spider-Man"

>>> superheroes[-1] # Count in reverse.
"Iron Man"
```

Let's Practice

- 1. What index is "Rose"?
- What index is "Clara"?
- What index is "Clara"? (answer with a negative index)
- 4. What is the length of the list (the # of elements)?

(any "Doctor Who" fans, btw?)

Lists: Basics

List creation

```
o empty_list = []
o letters = ["a", "b", "c", "d", "e"]
```

• Assigning new values to elements

```
o letters = ["a", "b", "c", "d", "e"]
o letters[3] = "x"  # letters -> ["a", "b", "c", "x", "e"]
```

Length of list

```
o letters = ["a", "b", "c", "d", "e"]
o len(letters) # 5
```

Check if an element is in a list using the Python keyword "in".

```
o if "b" in letters # True
o if "z" in letters # False
```

Lists: Other Useful Functions

- list.append(elem)
 - Add element to end of list.
- list.pop()
 - Remove element from end of list. Returns the element that was removed.
- list.pop(index)
 - Remove element from list at specified index.
- list.remove(elem)
 - Remove <u>first occurrence</u> of an element.
- del list[index]
 - Remove an element from a list at specified index. Doesn't return anything.
- list1.extend(list2)
 - Add all elements from list2 to the end of list1.
-and many other useful functions in the Python Docs!

Lists: How to Loop

How do you loop over the following list?

```
letters = ["a", "b", "c", "d", "e"]
```

• **Method 1:** Using regular "for" loop with range().

```
for i in range(len(letters)):  # len(letters) is 5
    print(letters[i])
```

• **Method 2:** Using "for-each" loop pattern.

```
for elem in letters:
    print(elem)
```

Dictionaries

- Dictionaries are similar to lists. They associate a <u>key</u> with a <u>value</u>.
 - Keys must be unique. Keys must be immutable types.

```
secret_identities = {"Batman": "Bruce Wayne", "Superman": "Clark Kent",
"Spider-Man": "Peter Parker", "Iron Man": "Tony Stark"}
```

In Python, you can also create a dictionary with the following formatting:

```
secret_identities = {
         "Batman": "Bruce Wayne",
         "Superman": "Clark Kent",
         "Spider-Man": "Peter Parker",
         "Iron Man": "Tony Stark"
}
```

Dictionaries: Basics

```
empty dict = {}
ages = {"Chris": 33, "Julie": 22, "Mehran": 50}
     Using a key to access its associated value (Method 1).
          ages["Chris"]
                        # 33
         ages["Santa Claus"] # KeyError (Program will crash.)
    Using a key to access its associated value (Method 2).
      o ages.get("Chris")
                            # 33
        ages.get("Santa Claus") # None (They keyword "None" is for null values.)
     Set a value to a key
          ages["Bronya"] = 25 # Will create a new key/value pair
      o ages["Mehran"] = 18
                                   # Will overwrite the existing value of 50
     Check if a key is in the dictionary using the Python keyword "in".
        if "Julie" in ages # True
          if "Santa Claus" in ages # False
```

Dictionaries: Other Useful Functions

- len(dict)
 - Returns the number of key/value pairs in the dictionary.
- dict.pop(key)
 - o Removes key/value pair with the given key. Returns value from that pair.
- del dict[key]
 - Removes key/value pair with the given key. Doesn't return anything.
- dict.keys()
 - Returns something similar to a range of keys in the dictionary.
- dict.values()
 - Returns something similar to a range of values in the dictionary.
-and many other useful functions in the Python Docs!

Dictionaries: How to Loop

Method 1: for-each key

```
for key in my_dict.keys(): # .keys() is optional. Can just use "my_dict".
    value = my_dict[key]
    print(key, value)
```

• Method 2: for-each value

```
for value in my_dict.values():
    print(value)
```

Method 3: for-each tuple of (key, value)

```
for key, value in my_dict.items():
    print(key)
    print(value)
```

Bonus Review

Mutability

Different data types have different behaviors when passed as parameters to another function.

Types that are "immutable"	Types that are "mutable"
int, float, bool, string	list, dictionary, canvas
If passed as a parameter for a function: The original variable value you passed in is not changed when function is done.	If passed as a parameter for a function: The original variable value you passed in is changed when function is done.

Mutability: Examples

Strings are immutable:

```
def main():
    message = "Hello"
    print(message)  # "Hello"
    depart(message)  # "Hello"

def depart(message)  # "Hello"

def depart(message):  # Pass in string as a parameter.
    message = "Goodbye"
```

• Canvas is mutable:

Mutability: Lists Are Mutable

- When you pass a list as a parameter, you are passing a <u>reference</u> to the actual list.
 - A reference is like getting a URL to the list.
 - Example: If I give you a URL to an editable Google Doc file, you can access the file using the URL and even make changes to it.
 - In a function, changes to values in list <u>persist</u> after the function ends.

```
def add_ten(num_list):
    for i in range(len(num_list)):
        num_list[i] += 10

def main():
    values = [6, 7, 8, 9]
    add_ten(values)  # Pass in a list as a parameter.
    print(values)  # Output: [16, 17, 18, 19]
```

Mutability: Dictionaries Are Mutable

- Keys must be <u>immutable</u> types (e.g. int, float, bool, string).
 - Keys <u>cannot</u> be changed "in place".
 - If you want to change a key, you must remove the key/value pair from dictionary and then add a key/value pair with new key.
- Values can be <u>mutable</u> or <u>immutable</u> types.
 - o Values can be changed "in place".
- Dictionaries are mutable.
 - Changes made to a dictionary in a function persist after the function is done.

Section Exercise: "Heads Up"

Take a list of words from a file and use it to recreate a console-based version of the "Heads Up" game!

Input

A text file (*.txt) containing the following lines:

Karel
For Loop
While Loop
If Statement
Else
Function
Parameter
Return Value
CS106A

Output

The word to guess: Karel

(Press "Enter" to get the next word.)

The word to guess: For Loop

(Press "Enter" to get the next word.)

The word to guess: While Loop (Press "Enter" to get the next word.)

•

•

Useful random **Library Functions for Lists**

Randomly shuffling the items in a list:

o random.shuffle(a_list)

```
fruits_list = ["apple", "banana", "cherry"]
random.shuffle(fruits_list)
print(fruits_list) # Will print a shuffled list
```

Returning a random item from a list:

o random.choice(a_list)

```
random_fruit = random.choice(fruits_list)
```

How to Read from a File

Method 1: Using the open-close pattern:

```
my_file = open("mydata.txt")
for line in my_file:
    line = line.strip()  # Gets rid of newline ("\n") character at end of line.
    print(line)
file.close()  # Close the file to free up program memory.
```

- Method 2: Using the with-as pattern:
 - At the end of the with block, the file is <u>automatically closed</u>.

```
with open("mydata.txt") as my_file:
    for line in my_file:
        line = line.strip()
        print(line)
```

Congratulations! You've made it through CIP 2024!

- I had such a great time being your Section Leader!
- Feel free to connect with me on LinkedIn.
 - https://www.linkedin.com/in/dwctsai/
 - Would appreciate any Endorsements for any Skills in my profile

Please look forward to the remainder of the course!

Thank You
